UV Coatings, Polarization, and Coronagraphy

Matthew R. Bolcar, Manuel Quijada, Garrett West (GSFC) Bala Balasubramanian, John Krist, Stefan Martin (JPL) Derek Sabatke (BATC)

Objectives

- Review of UV coatings and state-of-the-art
- Review of polarization aberration and the impact on coronagraphy
- Recent study results
 - HabEx
 - LUVOIR
- Work to be done

Objectives

- Review of UV coatings and state-of-the-art
- Review of polarization aberration and the impact on coronagraphy
- Recent study results
 - HabEx
 - LUVOIR
- Work to be done

• Sensitivity in the UV requires aluminum-coated mirrors

- Sensitivity in the UV requires aluminum-coated mirrors
- Aluminum oxidizes nearly instantly upon exposure to air (even at very low pressures)
 - Oxidation layer reduces UV reflectivity

- Sensitivity in the UV requires aluminum-coated mirrors
- Aluminum oxidizes nearly instantly upon exposure to air (even at very low pressures)
 - Oxidation layer reduces UV reflectivity
- Protective overcoats are used to prevent oxidation
 - Commonly fluoride overcoats, such as MgF₂, LiF, or AlF₃
 - Provide high reflectivity for wavelengths as short as ~110 nm
 - Shortward of 110 nm, reflectivity depends on material and deposition process

- AI + MgF₂
 - New "hot" deposition process heats substrate to 220° C
 - Improved reflectivity (> 85%) above 120 nm
 - Cutoff occurs around 115 nm with limited reflectivity shortward
 - ~20% reflectivity at 100 nm
- Al + LiF
 - Lower cutoff than MgF₂, achieving 80% reflectivity as low as ~105 nm
 - LiF is hygroscopic
 - Performance degrades with exposure to water vapor in air
 - Would require dry purge on mirrors during ground operations, OR
 - Requires an additional protective overcoat which can further suppress reflectivity
- $AI + AIF_3$
 - Promising new coating with low cutoff like LiF, and stability of MgF₂

UV Coatings, Polarization, and Coronagraphy

Objectives

• Review of UV coatings and state-of-the-art

 Review of polarization aberration and the impact on coronagraphy

- Recent study results
 - HabEx
 - LUVOIR
- Work to be done

How Coatings Affect Polarization

- Terminology:
 - *Diattenuation*: when each polarization state see a different amplitude upon reflection
 - *Retardance:* when each polarization state sees a different phase upon reflection

UV Coatings, Polarization, and Coronagraphy

How Coatings Affect Polarization

 There are two *mechanisms* of affecting the polarizationdependent amplitude and phase

• Polarization Aberration:

- Each polarization state acquires a different amplitude and wavefront error as it traverses the system
- Cross-polarization Leakage:
 - Some of each polarization state "leaks" into the orthogonal polarization state
- Net result is *four* incoherent (i.e. independent, uncorrelated) electric fields that must be corrected by the coronagraph

- Four incoherent (uncorrelated), aberrated fields
- If we do nothing:
 - Coronagraph senses and corrects the average electric field
 - Uncorrected portion contributes to contrast leakage

Potential Solution #1:

- Filter polarization at detector plane
- Image is constructed of only "x" polarization components
- Again, coronagraph senses and corrects the average of the remaining terms
- $E_{xx} >> E_{yx}$ so we get good, but imperfect correction
- But you lose 50% of the light at the detector

Potential Solution #2:

- Split polarizations before entering separate coronagraphs
- Still sensing average of primary and cross-polarization fields, so correction is good, but imperfect
- Retain 100% of the light
- Requires 2x coronagraphs (2x optics, 2x detectors, 2x DMs)

Other Mitigation Strategies

- Limit angles-of-incidence (AOI):
 - Slower primary and secondary mirror F/#'s
 - Avoid flat-fold mirrors at high AOI
 - Can be used in "crossed-pairs" to cancel each other out
 - Creates "long" optical systems which makes packaging and stability difficult

Other Mitigation Strategies

- Limit angles-of-incidence (AOI):
 - Slower primary and secondary mirror F/#'s
 - Avoid flat-fold mirrors at high AOI
 - Can be used in "crossed-pairs" to cancel each other out
 - Creates "long" optical systems which makes packaging and stability difficult
- Optimize coatings:
 - Simultaneously optimizing coating properties/prescription with the optical design can minimize polarization aberration effects

Other Mitigation Strategies

- Limit angles-of-incidence (AOI):
 - Slower primary and secondary mirror F/#'s
 - Avoid flat-fold mirrors at high AOI
 - Can be used in "crossed-pairs" to cancel each other out
 - Creates "long" optical systems which makes packaging and stability difficult
- Optimize coatings:
 - Simultaneously optimizing coating properties/prescription with the optical design can minimize polarization aberration effects
- Polarization compensating components:
 - Investigate active or passive devices that may be able to compensate polarization aberrations
 - Liquid crystals, nonlinear devices, etc.

Objectives

- Review of UV coatings and state-of-the-art
- Review of polarization aberration and the impact on coronagraphy
- Recent study results
 - HabEx
 - LUVOIR
- Work to be done

HabEx Polarization Study

- Design based on Exo-C Telescope resized from 1.4 m to 4.0 m diameter
- Telescope is an off-axis, unobscured Ritchey-Chretien design
- Produced a family of designs with primary mirror F#s of 2.5, 2.0, 1.5, 1.25
- For analysis, polarization wavefront analyzed from primary mirror to DM1
- Two scenarios:
 - Coatings on PM, SM, TM are aluminum, with silver on rest of optics, OR
 - All mirrors are silver

Four designs, Primary F#s 2.5, 2.0, 1.5 and 1.25

X-Y RMS WFE

HabEx: X-Y Polarization Wavefront Differences, f/2.5

Tilt & astigmatism are the main polarization aberrations

HLC: Post-EFC Contrast: 400-490 nm All polarizations

HLC: Post-EFC Contrast: 720-880 nm All polarizations

One Line Summary (courtesy J. Krist):

"Use overcoated Aluminum on the 1st three optics."

LUVOIR Polarization Study

- Four Ritchey-Chretien telescope designs generated:
 - 9m, 12m, 16m on-axis
 - 9m off-axis
- All designs have:
 - 3x3 arcmin diffraction-limited field-of-view
 - Same Primary-to-Secondary Mirror separation
 - Same focal length and hence same plate scale (pixel size on sky)
 - Aluminum-coated mirrors
- Primary mirror F/# varies with design:
 - F/1.1 for 16-m
 - F/1.45 for 12-m
 - F/1.95 for 9-m on-axis
 - F/1.96 for 9-m off-axis

LUVOIR Designs

LUVOIR Study is Ongoing

- Preliminary polarization aberration result is available for a single scenario:
 - 12-m on-axis design (F/1.45) at a wavelength of 1 μm

LUVOIR Study is Ongoing

• Preliminary polarization aberration result is available for a single scenario:

UV Coatings, Polarization, and Coronagraphy

Objectives

- Review of UV coatings and state-of-the-art
- Review of polarization aberration and the impact on coronagraphy
- Recent study results
 - HabEx
 - LUVOIR
- Work to be done

- LUVOIR needs to complete analysis of other designs and perform propagation through coronagraph
 - Of specific interest is the on- vs. off-axis trade

- LUVOIR needs to complete analysis of other designs and perform propagation through coronagraph
 - Of specific interest is the on- vs. off-axis trade
- Both studies should improve fidelity of coating models
 - Hubble Al+MgF₂ was used for HabEx, and Al+SiO₂ was used for LUVOIR
 - Update with newer MgF₂, LiF, or AlF₃ coating information

- LUVOIR needs to complete analysis of other designs and perform propagation through coronagraph
 - Of specific interest is the on- vs. off-axis trade
- Both studies should improve fidelity of coating models
 - Hubble Al+MgF₂ was used for HabEx, and Al+SiO₂ was used for LUVOIR
 - Update with newer MgF₂, LiF, or AlF₃ coating information
- Investigate optimizing coatings to balance/minimize polarization aberration

- LUVOIR needs to complete analysis of other designs and perform propagation through coronagraph
 - Of specific interest is the on-vs. off-axis trade
- Both studies should improve fidelity of coating models
 - Hubble Al+MgF₂ was used for HabEx, and Al+SiO₂ was used for LUVOIR
 - Update with newer MgF₂, LiF, or AlF₃ coating information
- Investigate optimizing coatings to balance/minimize polarization aberration
- If different coronagraph channels will be used to process each polarization orientation separately, need to understand impact of cross-polarization leakage

Summary

- Recent protected-Al coatings deliver high-reflectivity down to 110 nm
 - Performance below 110 nm depends on prescription and deposition processes

Summary

- Recent protected-Al coatings deliver high-reflectivity down to 110 nm
 - Performance below 110 nm depends on prescription and deposition processes
- Both LUVOIR & HabEx are pursuing parametric studies to understand trades with respect to telescope aperture and design

Summary

- Recent protected-Al coatings deliver high-reflectivity down to 110 nm
 - Performance below 110 nm depends on prescription and deposition processes
- Both LUVOIR & HabEx are pursuing parametric studies to understand trades with respect to telescope aperture and design

 HabEx study shows aluminum coating appears to be better than, or approximately equivalent to, silver coating with respect to polarization
